DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 6,326,302 (Joubert) in view of US Patent 6,869,542 (Desphande) and further in view of US Patent 6,069,090 (Eriguchi).

Joubert teaches using an etchant comprising O₂ and NH₃ etch an organic layer with an overlying SiO₂ hard mask.

Joubert does not teach using a Si-containing organic material as the overlying hard mask. Joubert does not teach the residence time of plasma species within the

plasma zone. Joubert does not teach controlling the CD shift by adjusting the ratio of O₂ and NH₃.

Desphande teaches using a Si-containing organic material as a hard mask when etching an underlying organic material.

Eriguchi teaches that CD shift can be controlled by controlling the flow rates of plasma gases.

It would have been obvious to one skilled in the art to incorporate the hard mask of Desphande into the process of Joubert because Desphande teaches that Si-containing hard masks sputter less readily than SiO₂ and they offer tighter CD control than conventional hard masks (column 5, lines 1-57).

It would have been obvious to one skilled in the art to optimize the flow rates of O₂ and NH₃ according to Eriguchi and in so doing the O₂ to NH₃ ratio and the plasma residence time would also be optimized.
